## GENERAL INFORMATION

---

- The new TPV-TPVT 4300 are variable displacement axial piston pumps with swash-plate system, for closed loop hydrostatic transmissions, that offer the best power to weight ratio because of new innovative design and production technologies.
- The flow rate is proportional to the rotation speed and is continuously variable according to the angle of the swash-plate from "0" to maximum displacement.
- The TPV-TPVT 4300 is equipped with a boost pump, "gerotor" type of new design and high efficiency to keep the circuit pressurised, to compensate the oil leakages of the hydrostatic transmission, to avoid cavitation of the piston pump and to supply low pressure oil flow to the remote controls of the pumps and of the hydraulic transmission (max 3 MPa).
- Different types of hydraulic or electro-proportional controls are available for remote regulation of the pump displacement by means of hydraulic or electric joysticks.  
The mounting flange is according to SAE-B 2 bolt, the through-drive is according SAE-A 2 bolt.  
Different other optionals are available for the TPV-TPVT 4300.
- The piston pumps are to be considered as individual components for the purposes of Directive 98/37/EC, therefore have been built to be integrated into a circuit or to be assembled with other components to form a machine or system. They can be operated only after they have been installed in the machine/system which they are intended for.
- The TPV-TPVT 4300 pumps must be used to create, manage and regulate oil flow in a closed loop system. Any other use should be considered improper.
- The pumps are built according to the technology normally used for this type of product. There is the risk of injury or damage to personnel during their installation and use if you do not respect the normal safety instructions or if used by untrained personnel.

## TECHNICAL SPECIFICATIONS

The housing and the distributor of the pumps TPV-TPVT 4300 are made in cast iron.

The flow rate is proportional to the rotation speed and the displacement is continuously variable. It increases as the swash-plate angle moves from "0" to maximum position.

If the swash-plate is positioned out of the neutral position, the flow respectively follows one of the two directions.

### Typical applications

- construction equipments
- green mowers
- zero turn machines
- agricultural machines
- utility vehicles
- forest vehicles
- logistic machines

### Key features

- compact design
- integrated optionals
- high power to weight ratio
- low noise integrated boost pump

PUMP MODEL		TPV 32	TPV 38	TPV 45	TPV 50

		$1 \text{ kg} = 2,205 \text{ lbs}$
		$1 \text{ N} = 0,2248 \text{ lbs}$

## PERFORMANCE DIAGRAM

### Performance diagrams

- The diagrams show the data of maximum speed and maximum continuous pressure.
- Data may vary depending on pump displacement.

### Pressure

- Continuous pressure: is the average pressure for continuous work, which must not be exceeded, to ensure a correct and long lasting service of the pump.
- Maximum pressure: is the maximum allowable pressure for short periods and must never be exceeded.

### Speed

- Continuous work speed: is the maximum

recommended speed for continuous operation of the pump under full load.

- Maximum speed: is the maximum permissible speed for the pump for short periods and not fully loaded. The use of the pump with this speed can reduce the life and cause a loss of power or of the hydrostatic braking capacity.

### Caution

Any damage caused to the pump can reduce or eliminate the hydrostatic braking capacity. It is therefore necessary to provide an auxiliary braking system capable of stopping and supporting the weight of the complete machine, in the event of loss of hydrostatic power.

## INSTALLATION INSTRUCTIONS

### Standards for the installation, start up and maintenance

- When mounting the pump above the minimum level of the tank, distance of the highest point of the pump over the oil level MUST NOT exceed 250 mm.
- To reduce the noise level typical of all piston pumps we recommend:
  - use hoses instead of pipes
  - limit to a minimum the length of eventual pipes
  - fix rigid pipe sections with special supports equipped with rubber vibration dampening devices
  - use pipes and hoses with a diameter according to the speed values below:

Suction line = 0,6 ÷ 1,2 m / s

Drain = 1,5 ÷ 3,6 m / s

Pressurized lines = max 6 m / s

- To calculate the speed of the oil in the lines refer to the formula below:

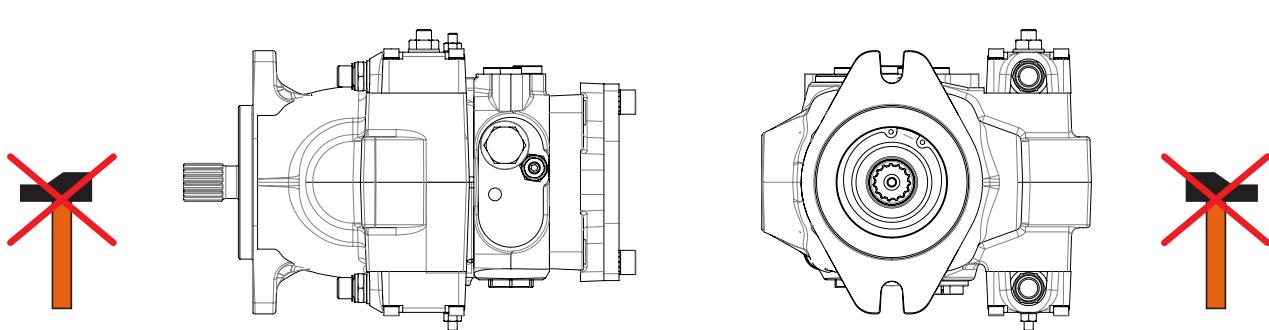

$$V = Q * 21,22 / D$$

V = speed (m/s)

Q = flow rate (l/min)

D = internal pipe/hose diameter (mm)

- In any case NEVER use pipes/hoses or fittings with diameter smaller than that of the corresponding ports on the pump. This indication is ABSOLUTELY OBLIGATORY for the drain line to avoid to pressurize the pump housing and extrude the lip seal of the pump shaft.
- During mounting cure the alignment of the pump, concentric with the drive shaft sleeve to prevent overloading of the bearing. See page 10.
- For the hydraulic system, we recommend using pipes/hoses washed internally with hydraulic oil or, even better, with solvent.
- Special care must be taken when cleaning the inside of the tank (painting is recommended after sand blasting).
- To improve the functionality of the boost pump, it is recommended to place it below minimum tank level.
- The pumps can be installed in any direction and position.  
For further information contact our Technical Department.

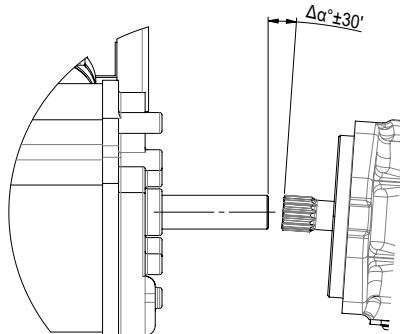

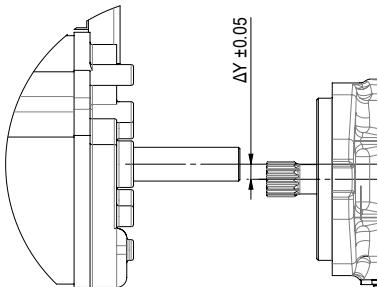

(continued)

## INSTALLATION INSTRUCTIONS

### Shaft Coupling

To connect the pump shaft to the engine flywheel or electric motor shaft use a flexible

coupling. The alignment must be within the tolerances indicated in the figures above. For an optimal function of the pump the shaft should not be subjected to radial or axial loads. During the installation or removal, do not force the coupling of the pump shaft, but always use the threaded hole on the shaft.

### Start up

- Before starting fill the tank and the other components with new filtered oil. You should run a flushing of the complete hydraulic system (see Use and Maintenance Manual). Check that the low pressure value is correct (refer to the Use and Maintenance Manual).
- Restore the oil level in the tank.

### Maintenance

- The first oil change should be made after 500 hours of operation. Later change the oil every 2000 hours.
- The first replacement of the filter cartridge has to be made after 50 hours for a preliminary circuit cleaning. Then after further 500 hours.
- These frequencies have to be reduced in the case where the indicator shows the clogging of the filter cartridge and in case of operation in environments with a high level

of contamination.

- Always work with the utmost attention to the moving parts; do not use loose or fluttering clothing.
- Do not approach rotating wheels, tracks, chains or shafts if not properly protected, or when they may start moving without notice.
- Do not loosen or disconnect fittings and pipes/hoses while the engine is running.
- Avoid oil leaks in order to prevent environmental pollution.

### Load capacity of rear shaft (through drive shaft)

- The rear shaft is not able to carry radial loads.

## HYDRAULIC FLUID

### Viscosity

The maximum duration and the maximum efficiency are related to the optimum range of viscosity.

Optimal operating viscosity 15 ÷ 40 cSt referred to the temperature of the closed circuit.

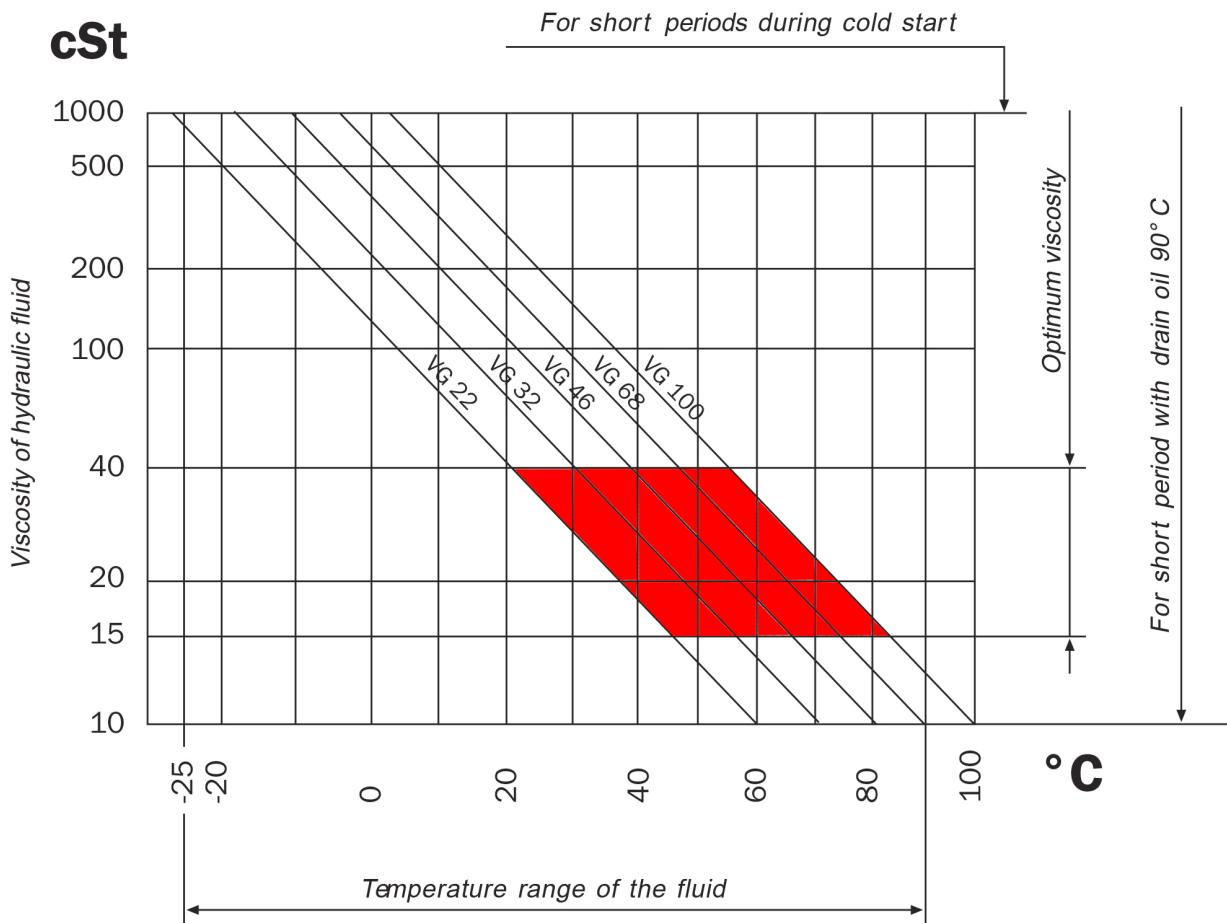

and with the maximum temperature of the drain oil at 90 °C.

Max. viscosity = 1000 cSt for a few seconds, only during cold starting.

### Working conditions

For working conditions apply the following limits:

Minimum viscosity = 10 cSt for short moments

**HANSA - TMP cannot be held responsible concerning non compliance of these instructions and observance of safety regulations, although not covered by this document.**

## HYDRAULIC FLUID FILTRATION

---

The contaminating particles suspended in the hydraulic fluid cause the wear of the hydraulic mechanisms moving parts.

On hydraulic pumps these parts operate with very small dimensional tolerances.

In order to prolong the parts life, it is recommended to use a filter that maintains the hydraulic fluid contamination class at max.

- 8 according to NAS 1638
- 5 according to SAE, ASTM, AIA
- 19/17/14 according to ISO 4406

According to the type of application decided for the pump, it is necessary to use filtration elements with a filtration ratio of:

$$\beta_{(x)} 20 \div 30 \geq 75$$

making sure that this ratio does not worsen together with the increasing of the filter cartridge differential pressure. While the pump is working, its temperature increases (over 80° to 110°C) with negative effects on pump performances; as a consequence, it is important to observe a max. contamination level of:

- 7 according to NAS 1638
- 4 according to SAE, ASTM, AIA
- 18/16/13 according to ISO 4406

If these values cannot be secured, the component life will consequently be reduced and it is recommended to contact our Tech. Dept.

### Suction filters

The suction filters must have a clogging indicator and bypass. The max. pressure drop of the filtration element must not exceed 0,04 absolute MPa (0,08 absolute MPa with cold start).

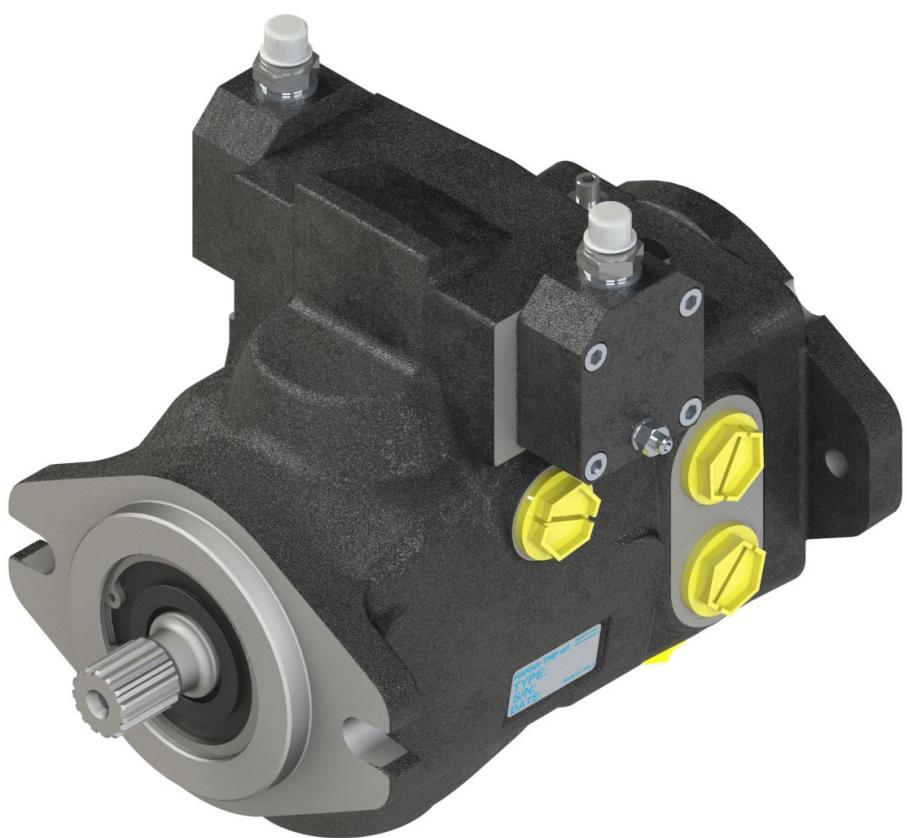

### Filter assembling

The suction filter is mounted in the suction line. Check that the pressure before the boost pump is 0,08 absolute MPa, measured on the

pump suction port (0,05 MPa for cold starting).

## **HYDRAULIC SERVO CONTROL**

The pump displacement variation is obtained by adjusting the pressure on P1 and P2 servo control ports by means of a hydraulic proportional joystick (with integrated pressure reducing valves).

The servo control supply can be obtained by taking pressure from the boost pump (G port), see pag. 16.

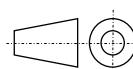

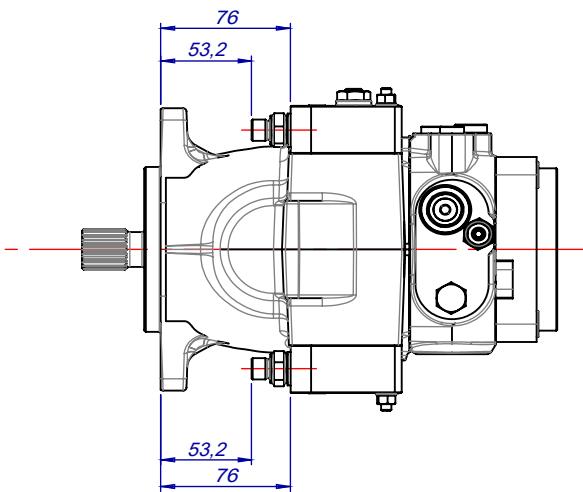

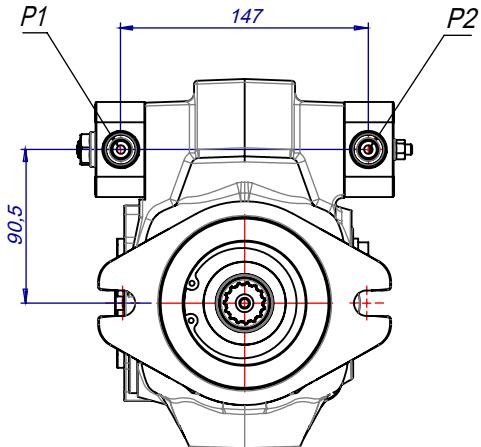

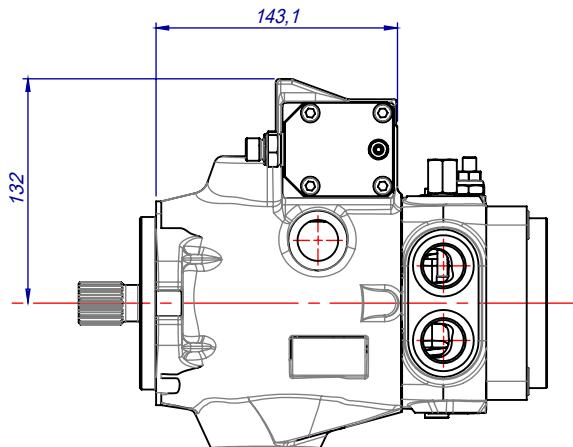

The servo control return time can be adjusted

by inserting a restrictor on the joystick supply line (0,5 ÷ 1,2 mm).

The servo control operation curve, in both directions, goes from 0,4 to 1,8 MPa (tolerance ( $\pm 5\%$ )).

The adjusting curve of the hydraulic joystick has to be a little wider (0,3 ÷ 1,9 MPa).

Suggested curves for HPV series Joysticks: CR062 (see HT 73/B/105/0417/E catalogue).

## OPTIONAL CO (--)

### PRESSURE CUT-OFF VALVE (PRESSURE SETTING)

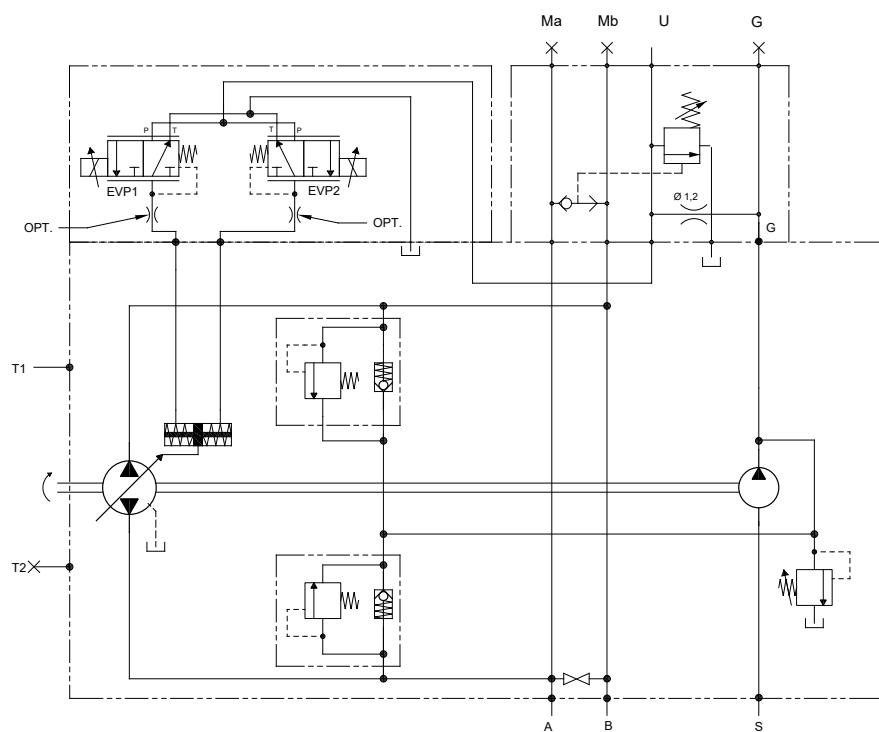

The CO pressure cut-off valve, when the set pressure is reached, reduces the displacement of the pump in order to maintain a constant working pressure.

The valve operates in place of the pressure relief valves of the pump and increases the energy efficiency of the machine.

The cut-off valve set pressure must be 3 MPa bar lower than the setting of the relief valves.

## GENERAL DIMENSIONS/TANDEM PUMP PORTS

## SHI

### HYDRAULIC SERVO CONTROL

The pump displacement variation is obtained by adjusting the pressure on P1, P2, P3 and P4 servo control ports by means of a hydraulic proportional joystick (with integrated pressure reducing valves).

The servo control oil supply can be obtained by taking pressure from the boost pump (G1 - G2 ports), see pag. 49.

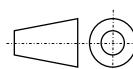

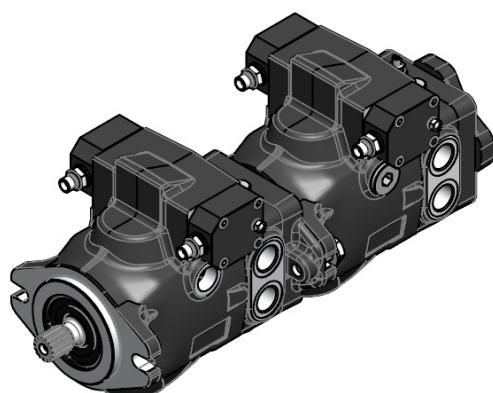

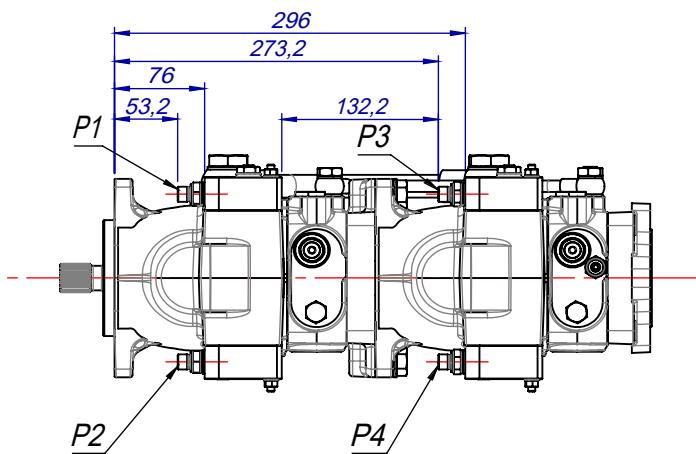

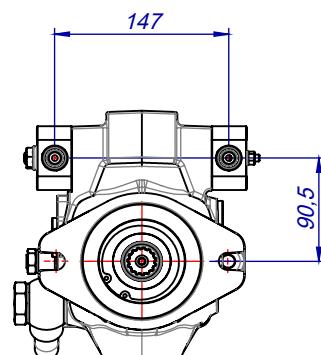

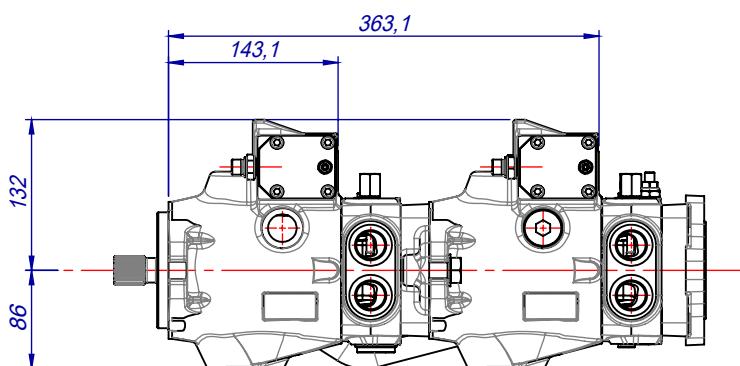

The servo control return time can be adjusted

by inserting a restrictor on the joystick supply line (0,5 ÷ 1,2 mm).

The servo control operation curve, in both directions, goes from 0,4 to 1,8 MPa (tolerance  $\pm 5\%$ ).

The adjusting curve of the hydraulic joystick has to be a little wider (0,3 ÷ 1,9 MPa).

Suggested curves for HPV series Joysticks: CR062 (see HT 73/B/105/0417/E catalogue).

## OPTIONAL MOB SEI

### MAN ON BOARD

On the pump a normally open electrical operated valve can be fitted. The valve allows the flow delivery only when energized. This function is used to increase the safety of the machine. The solenoid valve is available for 12V or 24V DC voltage.

HYDRAULIC DIAGRAM

(continued)

## OPTIONAL MOB SEI

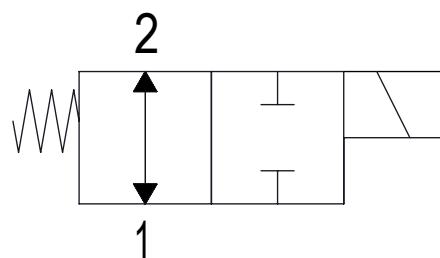

### MAN ON BOARD

#### TECHNICAL FEATURES

TECHNICAL CHARACTERISTICS	
Maximum pressure	25 MPa
Maximum flow	10 l/min.
Leakage	max. 80 cc/min. at 25 MPa
Response time	30 ms
Temperature	-30°C / +110°C

ELECTRIC CHARACTERISTICS	
Voltage	12V / 24V
Insulation class	F
Power	18W
Tolerance of supply	+10% / -5% AC
Ambient temperature	-30°C / +60°C
Connector *	DIN 43650 Deutsch (90°)

\* Other types of connectors are available.

## TROUBLE SHOOTING

---

TROUBLES	CAUSE	REMEDY
High noise level	Too high rotation speed of the pump.	Reduce pump rotation speed.
	Wrong rotation direction.	Check the rotation direction of the pump.
	Obstruction in suction line - air in the suction line - wrong oil viscosity - diameter of suction line too small.	Check oil type and viscosity. Check internal diameter of suction line. Remove restrictions. Check oil level of reservoir. Eliminate air intake.
	Not correct connection of the pump. Not correct diameter of pipes / hoses.	Check the pump connections and the pipe / hose diameters according to notes.
	Vibrations of relief valves .	Check the inlet suction line - Check and replace relief valves.
	Internal parts worn out.	Check and replace.
	Wrong pump connection to the prime mover.	Check connection and rotation of direction.
	Too low rotation speed of the pump.	Increase the pump rotation speed.
Low flow rate	Obstructions in the suction line - wrong viscosity.	Check oil type and viscosity. Check internal diameter of suction line. Remove restrictions. Check oil level of reservoir. Eliminate air intake.
	Low remote control pressure.	Check and adjust.
	High internal leakage.	Check the case drain flow.
	Low rotation speed of the pump.	Increase speed of the pump.
Instable or low pressure	Obstruction of suction line - air in the suction line - wrong oil viscosity - diameter of suction line too small.	Check oil type and viscosity. Check internal diameter of suction line. Remove restrictions. Check oil level of reservoir. Eliminate air intake.
	Vibration of relief valves.	Check the inlet suction line. Check and replace relief valves.
	Internal parts worn out.	Check and replace.
Over heating	High oil temperature at suction inlet.	Check the cooling system.
	Internal parts worn out.	Check - replace.
	Wrong setting of relief valves.	Check - adjust the setting of relief valves.

## ACCESSORIES

**Hydraulic Gear Pump German Standard B1**

For more detailed information ask  
for catalogue HT 15 F 20.....

**Hydraulic Gear Pump German Standard B2**

**Hydraulic Gear Pump SAE-A Standard**

### Hydraulic Remote Servo Controls

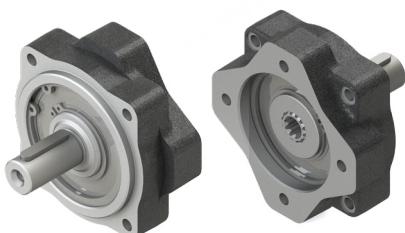

For more detailed information ask  
for catalogue HT 73 B 105 0919 E

### Electric and Electronic Remote Servo Controls

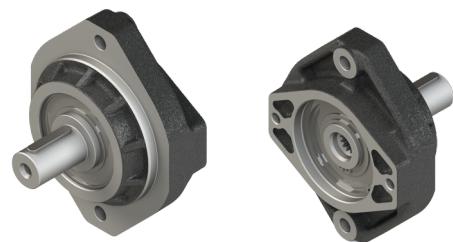

For more detailed information ask  
for catalogue HT 73 B 203 0516 E

### Belt Drive Support BDS SAE-A / SAE-B

**SAE-A**

For more detailed information ask

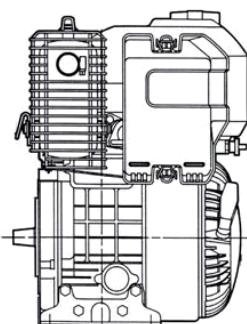

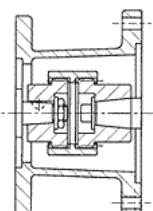

**SAE-B**

### Bell Housings and Couplings for Pump Assembly on Internal Combustion Engines

INTERNAL COMBUSTION  
ENGINES

BELL HOUSINGS  
AND COUPLINGS

## PUMPS

Closed Loop Axial Piston Pumps (Variable Displacement) - 6-110 cc

Model	Displacement cm <sup>3</sup> /n.	Rated Pressure MPa	Peak Pressure MPa	Maximum speed n/min.	Weight kg (single pump)
TPV 1100	6, 8, 9, 11, 12, 13	30	35	3.600	8,8
	15, 17		30		
	18		30		
	19, 21	22	28	3.200	
TPV-TPVTC 1500	17, 18, 19, 21	35	40	3.600	14
TPV 3200	21, 28	25	35		22
TPV-TPVT 3600	26, 28, 30, 31, 32, 34, 36, 38, 43	40	45		28
TPV 4300	32, 38, 45, 50	28	35		23
TPV 5000	46, 50, 64	30	40		29
TPV 9000	55	40	45	4.000	55
	72			4.100	68
	90			4.000	
	110			3.800	

Open Loop Axial Piston Pumps (Fixed Displacement) - 32-50 cc

Model	Displacement cm <sup>3</sup> /n.	Rated Pressure MPa	Peak Pressure MPa	Maximum speed n/min.	Weight kg (single pump)
TPF 60	35, 40, 46	35	42	2.800	20,5
	50		41	2.500	

Bent Axis Pumps - 12-130 cc

Model	Displacement cm <sup>3</sup> /n.	Rated Pressure MPa	Peak Pressure MPa	Maximum speed n/min.	Weight kg
TPB - TAP 70	12.6	35	40	3.300	7,5
	17.0			3.200	
	25.4			2.550	8,5
	34.2			2.250	
	41.2, 47.1			2.200	15,5
	56.0			2.100	
	63.6			2.050	
	83.6, 90.7, 108.0			1.700	
	130.0			1.600	29,5

The table values can change in function of the configuration.

As HANSA-TMP has a very extensive range of products and some products have a variety of applications, the information supplied may often only apply to specific situations.

If the catalogue does not supply all the information required, please contact HANSA-TMP.

In order to provide a comprehensive reply to queries we may require specific data regarding the proposed application.

Whilst every reasonable endeavour has been made to ensure accuracy, this publication cannot be considered to represent part of any contract, whether expressed or implied.

The data in this catalogue refer to the standard product.

The policy of HANSA-TMP consists of a continuous improvement of its products. It reserves the right to change the specifications of the different products whenever necessary and without giving prior information.
